### An introduction to Shape Expressions

And how they can be used to implement integrity and classification constraints within the **@Web** platform

Leandro Lovisolo leandro.lovisolo@supagro.inra.fr

INRA SupAgro and INRIA GraphiK Montpellier, France

October 5, 2015

### Outline of the presentation

- ► Introduction to Shape Expressions
- Examples of integrity and classification constraints for the
   @Web platform written as Shape Expressions
- Comparision with equivalent constraints written as SPARQL queries
- Survey of the available libraries implementating of Shape Expressions

Definition

▶ It's a validation language for RDF graphs.

- ▶ It's a validation language for RDF graphs.
- ▶ Allows specifying patterns, or *shapes*, that triples in an RDF graph must conform to.

- It's a validation language for RDF graphs.
- Allows specifying patterns, or shapes, that triples in an RDF graph must conform to.
- ▶ Lets one decide whether a RDF graph satisfies all the required shapes.

- It's a validation language for RDF graphs.
- Allows specifying patterns, or shapes, that triples in an RDF graph must conform to.
- ▶ Lets one decide whether a RDF graph satisfies all the required shapes.
- Also possible to deduce which triples conform to which shapes (useful for classification.)

- It's a validation language for RDF graphs.
- Allows specifying patterns, or shapes, that triples in an RDF graph must conform to.
- ▶ Lets one decide whether a RDF graph satisfies all the required shapes.
- Also possible to deduce which triples conform to which shapes (useful for classification.)
- Roughly comparable to what the Data Definition Language (DDL) does for SQL databases, or what XML Schema does for XML documents.

- An issue:
  - ▶ is reported by a user,

- ► An issue:
  - is reported by a user,
  - is reported on some date,

- An issue:
  - is reported by a user,
  - is reported on some date,
  - can be reproduced by an user on some date,

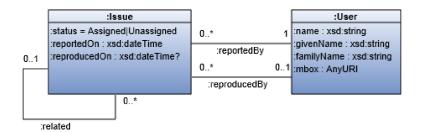

- An issue:
  - is reported by a user,
  - is reported on some date,
  - can be reproduced by an user on some date,
  - is either assigned or unassigned,

- An issue:
  - ▶ is reported by a user,
  - is reported on some date,
  - can be reproduced by an user on some date,
  - is either assigned or unassigned,
  - is related to other issues.

- A user:
  - has one full name, OR
  - has several given names and one family name,
  - can have one mbox.

### Example data (Turtle syntax)

#### Valid

```
:Issue1
  :status :unassigned ;
  :reportedBy :Bob ;
  :reportedOn "2013-01-23"^^xsd:date ;
  :reproducedBy :Thompson ;
  :reproducedOn "2013-01-23"^^xsd:date .
: Bob
 foaf:givenName "Bob" ;
 foaf:familyName "Smith" ;
 foaf:mbox <mail:bob@example.org> .
:Thompson
 foaf:givenName "Joe", "Joseph";
 foaf:familyName "Thompson" ;
 foaf:mbox <mail:joe@example.org> .
```

#### Invalid

```
:Issue2
  :status :checked : # invalid :status.
  :reportedBy :Bob ;
  :reportedOn "2013-01-23"^^xsd:date ;
  :reproducedOn "2013-01-20"^^xsd:date :
    # missing :reproducedBy.
    # :reproducedOn earlier than
    # :reportedOn.
: Anna
 foaf:givenName "Bob" ;
    # missing :familyName.
 foaf:mbox <mail:bob@example.org> .
:Pete
 foaf:name "Peter", "Pete";
    # multiple foaf:names.
```

### Shape Expression: User

```
<UserShape> {
  ( foaf:name xsd:string |
    foaf:givenName xsd:string+ ,
    foaf:familyName xsd:string
  ),
  foaf:mbox shex:IRI ?
}
```

### Shape Expression: Issue

▶ Using this language, we define a *schema*.

- ▶ Using this language, we define a *schema*.
- ▶ A schema is just a set of *shape expressions*.

- Using this language, we define a schema.
- ▶ A schema is just a set of *shape expressions*.
- ▶ A shape expression is a labelled *pattern*, e.g.:

```
<label>: {
    ... pattern ...
}
```

- Using this language, we define a schema.
- ▶ A schema is just a set of *shape expressions*.
- A shape expression is a labelled pattern, e.g.:

```
<label>: {
    ... pattern ...
}
```

▶ A pattern is a *conjunction* (denoted with a comma) of several *expressions*, e.g.:

```
<IssueShape>: {
    :status ( :unassigned :assigned ), # an expression
    :reportedBy @<UserShape>, # another expression
    :reportedOn xsd:date, # yet another expression
    ...
}
```

### An expression can be:

▶ An arc rule, which is a name definition followed by a value definition, e.g.:

```
# name definition # value definition
:reportedOn xsd:date
```

#### An expression can be:

► An arc rule, which is a name definition followed by a value definition, e.g.:

```
# name definition # value definition
:reportedOn xsd:date
```

► A group rule which groups several rules as a single rule (useful for cardinality constraints), e.g.:

```
( :reproducedBy @<EmployeeShape>,
    :reproducedOn xsd:dateTime )?
```

#### An expression can be:

► An arc rule, which is a name definition followed by a value definition, e.g.:

```
# name definition # value definition
:reportedOn xsd:date
```

A group rule which groups several rules as a single rule (useful for cardinality constraints), e.g.:

```
( :reproducedBy @<EmployeeShape>,
    :reproducedOn xsd:dateTime )?
```

► A list of *alternatives* such that the expression matches any of the alternatives in the list, e.g.:

```
( foaf:name xsd:string |
  foaf:givenName xsd:string+, foaf:familyName xsd:string )
```

The possible *cardinality constraints* are:

The possible *cardinality constraints* are:

```
? for rules with cardinality 0 or 1, e.g.:
```

```
( :reproducedBy @<UserShape>,
    :reproducedOn xsd:dateTime )?
```

The possible *cardinality constraints* are:

```
? for rules with cardinality 0 or 1, e.g.:
```

```
( :reproducedBy @<UserShape>,
    :reproducedOn xsd:dateTime )?
```

\* for rules with cardinality at least 0, e.g.:

```
:related @<IssueShape> *
```

The possible *cardinality constraints* are:

```
? for rules with cardinality 0 or 1, e.g.:
```

```
( :reproducedBy @<UserShape>,
    :reproducedOn xsd:dateTime )?
```

\* for rules with cardinality at least 0, e.g.:

```
:related @<IssueShape> *
```

+ for rules with cardinality at least 1, e.g.:

```
foaf:givenName xsd:string+
```

The possible *cardinality constraints* are:

```
? for rules with cardinality 0 or 1, e.g.:
```

```
( :reproducedBy @<UserShape>,
    :reproducedOn xsd:dateTime )?
```

\* for rules with cardinality at least 0, e.g.:

```
:related @<IssueShape> *
```

+ for rules with cardinality at least 1, e.g.:

```
foaf:givenName xsd:string+
```

▶  $\{m, n\}$  for rules with cardinality between m and n.

A name definition matches predicate names. Can be either:

▶ an IRI, e.g. foaf:name

A name definition matches predicate names. Can be either:

- ▶ an IRI, e.g. foaf:name
- ▶ an IRI prefix, e.g. foaf:~

A name definition matches predicate names. Can be either:

- ▶ an IRI, e.g. foaf:name
- an IRI prefix, e.g. foaf: ~
- any predicate except some from a list, e.g. " foaf:name"
  matches any predicate but foaf:name

A name definition matches predicate names. Can be either:

- ▶ an IRI, e.g. foaf:name
- ▶ an IRI prefix, e.g. foaf:~
- any predicate except some from a list, e.g. " foaf:name"
  matches any predicate but foaf:name
- ▶ any predicate at all, denoted by the symbol dot (.)

A value definition places a constraint on the kinds of nodes that can be referenced by a predicate. Can be either:

▶ A value type, e.g. xsd:date

A value definition places a constraint on the kinds of nodes that can be referenced by a predicate. Can be either:

- A value type, e.g. xsd:date
- A value set matching any nodes within a set, e.g. (:assigned, :unnasigned)

A value definition places a constraint on the kinds of nodes that can be referenced by a predicate. Can be either:

- A value type, e.g. xsd:date
- A value set matching any nodes within a set, e.g. (:assigned, :unnasigned)
- Any value except those in a particular set, e.g. " : checked"

A value definition places a constraint on the kinds of nodes that can be referenced by a predicate. Can be either:

- ▶ A value type, e.g. xsd:date
- ▶ A value set matching any nodes within a set, e.g. (:assigned, :unnasigned)
- Any value except those in a particular set, e.g. " : checked"
- A node that has a particular shape, e.g. @<UserShape>

Shape inheritance can be achieved by using the ampersand symbol (&), e.g.:

```
<PersonShape> {
    ( foaf:name xsd:string
      | foaf:givenName xsd:string+,
        foaf:familyName xsd:string
    foaf:mbox IRI
<UserShape> {
    & <PersonShape>
<EmployeeShape> {
    & <PersonShape>,
    foaf:phone IRI+
```

*Semantic actions* are arbitrary snippets of code that are executed after a rule is evaluated.

Semantic actions are arbitrary snippets of code that are executed after a rule is evaluated.

Possible to express complex validation rules using.

Semantic actions are arbitrary snippets of code that are executed after a rule is evaluated.

- Possible to express complex validation rules using.
- Multiple programming languages can be supported, depending on the implementation of shape expressions.

Semantic actions are arbitrary snippets of code that are executed after a rule is evaluated.

- Possible to express complex validation rules using.
- Multiple programming languages can be supported, depending on the implementation of shape expressions.
- ▶ Other uses: transforming RDF triplets into different formats, generating forms for user interfaces automatically, etc.

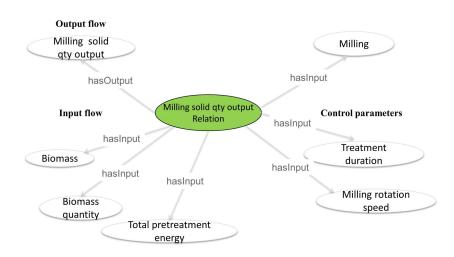

Semantic actions are arbitrary snippets of code that are executed after a rule is evaluated.

- Multiple programming languages can be supported, depending on the implementation of shape expressions.
- ▶ Other uses: transforming RDF triplets into different formats, generating forms for user interfaces automatically, etc.

#### Example:

```
:reportedOn xsd:dateTime
    %js{ report = _.o; return true; %},
(:reproducedBy @<EmployeeShape>,
    :reproducedOn xsd:dateTime
    %js{ return _.o.lex > report.lex; %}
    %sparql{ ?s :reportedOn ?rpt . FILTER (?o > ?rpt) %})
```

#### Milling solid quantity output relation

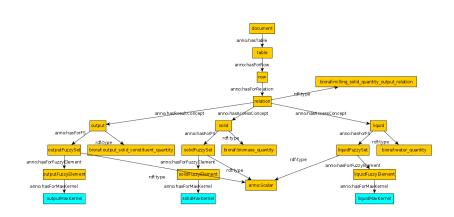

# An integrity constraint Guideline

"The output quantity of a step is equal to the sum of the quantity of water used and the quantity of biomass present in the step."

#### SPARQL query

```
SELECT ?docid ?doctitle ?tableid ?tabletitle ?rownum ?solid gtv ?liquid gtv ?output gtv
WHERE {
?doc anno:hasForID ?docid ;
     dc:title ?doctitle :
     anno:hasTable ?table ...
?table anno:hasForID ?tableid :
      dc:title ?tabletitle :
      anno:hasForRow ?row .
?row anno:hasForRowNumber ?rownum :

  - Implemented in the JavaScript programming language
  - Prototype/proof-of-concept implementation of shape expressions
  - Handles semantic actions

#### ShExcala

- ▶ Implemented in the Scala programming language
- ► Can be used from any JVM language (good for **@Web**)
- Doesn't implement semantic actions

#### FancyShExDemo

- Implemented in the JavaScript programming language
- Prototype/proof-of-concept implementation of shape expressions
- Handles semantic actions
- Able to generate SPARQL queries

Integrity constraint (milling solid output quantity relation):

Integrity constraint (milling solid output quantity relation):

▶ Detected **22** inconsistencies out of **79** instances of the relation.

Integrity constraint (milling solid output quantity relation):

▶ Detected **22** inconsistencies out of **79** instances of the relation.

Classification constraint (BIOREF-PM topic):

Integrity constraint (milling solid output quantity relation):

▶ Detected **22** inconsistencies out of **79** instances of the relation.

Classification constraint (BIOREF-PM topic):

► Found **342** candidate experiments in **30** different documents.
